# Access Solutions

Powertherm's access solutions incorporate a comprehensive range of innovative, cost-effective products and services that are guaranteed to keep your teams safe.

Whether using a conventional scaffold, system scaffold, rope access, MEWPs or working within a confined space, we offer access solutions that meet the highest safety standards and ensure that nowhere is inaccessible for your business.

Our team of specialists are trained to erect and dismantle scaffolds, operate mobile equipment, manage confined spaces and more. Although cost-effective, we never compromise on quality. Instead, we build strong, trusted relationships with our clients through understanding and applying the most suitable and safe method of access.

## Specialist Support Services

Powertherm provides all types of encapsulation solutions against potential contamination and adverse weather conditions. This protects your work site and the surrounding environment, shielding personnel and saving time in the long run. Our expertise enables projects to continue with minimal disruptions or unexpected costs.

Where required, we also have the competencies to provide:

- > Auditing, inspections, & surveys
- > Design drawings & supporting calculations
- > Project programmes & safety procedures

## Scaffolding

Powertherm offers a full range of scaffolding services with the competence to use both traditional tube & fitting or system scaffolds. Offering both types of scaffolds gives us the flexibility to provide technically advanced systems which can be made to fit around even the most irregular shapes & profiles or for large scale structures and where modifications are required.

All scaffolds are erected in accordance with the latest NASC technical and safety guidance, and are monitored on-site for safety by one of our highly-trained health and safety experts. All Powertherm operatives hold Construction Industry Scaffolder's Record Scheme (CISRS) qualifications, underlining our commitment to ensuring the highest levels of safety and quality.

## Rope Access

Rope access teams can be the safest and most efficient method of gaining entry, particularly for out-of-reach locations where minimal tools and materials are required, or where critical access is required in emergencies.

Powertherm has in-house rope access teams that can quickly mobilise when required. This enables us to use rope access teams alongside other services for a fast, cost-effective solution: everything from system inspections to industrial cleaning and insulation removal. All Powertherm rope access workers are IRATA trained, so safety is never compromised.

## Mobile Elevating Work Platforms (MEWPs)

Mobile elevating work platforms are an efficient and effective alternative for situations where it may not be practical or financially viable to use scaffolding or rope access solutions.

Powertherm offers a full design and planned management system for each project, identifying the most effective type of MEWP required for your specific requirements. All our machines are fitted with the latest safety features, including Intelligent Secondary Guarding and Skysiren technology.

## Confined Space Management

Our confined space management solutions ensure you have the correct plans, procedures and expertise in place for any situation that requires your team to work in small, enclosed spaces.

We offer confined space management and rescue as both a standalone service or incorporated into a larger maintenance contract or construction project. Our team of experts will gain a deep understanding of your own specific situation and requirements, minimising potential future errors.
